

CASE STUDY

PERCON CONSTRUCTION

SUMMARY STATEMENT

Percon Construction Inc. is a full service contractor/builder with the capability, knowledge and expertise to take on mid to large-size industrial, commercial, and institutional projects.

Percon Construction Inc. aims to build facilities that serve the general public and the communities in which they stand by maintaining the highest possible industry standards.

THE CHALLENGE

Like many companies, Percon Construction's Occupational Health and Safety clerical tasks used to be completed manually, by a team that would have much rather spent the excessive administration hours in the field, communicating directly with company personnel.

The tedious nature of the work lent itself to the possibility of human error. Their cumbersome, paper-based system required manual entry, analysis, review, and maintenance on a near constant basis.

Much of the manual entry tasks cost days out of each month and quarter. Percon Construction had to find a more efficient system that both centralized and streamlined their health and safety management. Their search led them to eCompliance.

“

All of our site documents were being scanned and emailed to the office.

Once received, these would be printed & filed and the information within them would be logged manually into a series of spreadsheet files, which were then colour coded to track corrective actions.

An Easy-To-Use Web Based Program That Simplifies EHS Management

The eCompliance management system is the first software Percon Construction had used specifically designed for health and safety, centralizing their organizational concerns into one system.

They have made it accessible to everyone, in the office or the field (through the mobile application), who need it. In addition, its easy usability ensured the system is being widely adopted.

Maren Gamble, Percon Construction's Health & Safety Manager, says, "eCompliance has proven to be far more user-friendly for the less technologically-savvy employees than trying to use and manage email, computers, printers, scanners, and internal webpages.

Where some aspects of our program weren't being accessed before, they're now being used on a regular basis, even by those who were intimidated by the idea at first."

Percon Construction Inc. were successfully able to overcome the challenge of their manual, paper-based EHS system which yielded a high risk of human error by engaging with eCompliance.

“

With eCompliance, our supervisors are able to login, fill out paperwork quickly within the system, and then receive it at our office right away for review.

So much of what was once done manually is now done automatically.

”
